

Happy Days

Happy Days is an android application that promotes a healthy lifestyle for the citizens of New Westminster. The app accomplishes this by providing users with the ability to log their days in order to look back at the "Happy Days" when they are feeling down.

The project was a part of the New Westminster and Maple Ridge android event that was held for BCIT students. I worked in a team of three students where we split up the tasks into three main components: Activities, Logs, and Notifications. My main responsibility was to implement the Activities component of the project. I utilized the open datasets provided by the city of New Westminster and MapBox SDK for Android to draw popular walking, running, and cycling routes within the city.

The project won first place in the health category during the New Westminster and Maple Ridge showcase event at the BCIT downtown campus.

Technologies Used:

Java

Android

A mobile responsive web application built using Node/Express that aims to reduce food waste by allowing users to search recipes based on the food ingredients that are about to expire in their fridge.
